

Delivery Tips

Airtight Container World can have your container delivered on a purpose built tilt bed delivery system and will make every attempt to place your container exactly where you want it or we can have it delivered on a flat bed if you have the means to lift off the container at destination.

Here are some tips about delivery to insure your delivery goes smoothly:

- Your ground should be flat and level preferably with a gravel, asphalt, or concrete surface. The area must be clear of debris, bushes, tree branches etc.
- If you want to drop your container directly on the ground understand that it weighs from 5,000lbs for a 20' to 8,500lbs for a 40' container. If the ground gets wet and it is a mud, clay base, or recently paved asphalt, your container will settle in overtime and may set into the site.
- The 20' tilt bed truck delivery system requires 55' straight clearance to drop a 20' container.
- The 40' tilt bed truck delivery system requires 110 ft. straight clearance to drop a 40ft. container.
- There must be 10' of width clearance and at least 25' of overhead clearance to accommodate the tilting of the trailer.
- You must determine if you want to have the doors to cab or doors to rear.
